C Keywords - Reserved Words

In C, we have 32 keywords, which have their predefined meaning and cannot be used as a variable name. These words are also known as "reserved words". It is good practice to avoid using these keywords as variable name. These are –

C KEYWORDS OR RESERVED WORDS				
auto	break	BeginnersB case	char	
const	continue	default	do	
int	long	register	return	
short	signed	sizeof	static	
struct	switch	typedef	union	
unsigned	void	volatile	while	
double	else	enum	extern	
float	for	goto	if	

Basics usage of these keywords -

if, **else**, **switch**, **case**, **default** – Used for decision control programming structure.

break – Used with any loop OR switch case.

int, **float**, **char**, **double**, **long** – These are the data types and used during variable declaration.

for, **while**, **do** – types of loop structures in C.

void – One of the return type.

goto – Used for redirecting the flow of execution.

auto, signed, const, extern, register, unsigned – defines a variable.

return – This keyword is used for returning a value.

continue – It is generally used with for, while and dowhile loops, when compiler encounters this statement it performs the next iteration of the loop, skipping rest of the statements of current iteration.

enum – Set of constants.

sizeof – It is used to know the size.

struct, typedef – Both of these keywords used in structures (Grouping of data types in a single record).

union – It is a collection of variables, which shares the same memory location and memory storage.

volatile

operator precedence and Associativity in C programming language

Operator Precedence in C

Operator precedence determines which operator is evaluated first when an expression has more than one operators. For example 100-2*30 would yield 40, because it is evaluated as 100 - (2*30) and not (100-2)*30. The reason is that multiplication * has higher precedence than subtraction(-).

Associativity in C

Associativity is used when there are two or more operators of same precedence is present in an expression. For example multiplication and division arithmetic operators have same precedence, lets say we have an expression 5*2/10, this expression would be evaluated as (5*2)/10 because the associativity is left to right for these operators. Similarly 20/2*5 would be calculated as (20*2)/5.

Operator precedence and Associativity Table in C Programming

Description	Operator	Associativity			
Function expression	()	Left to Right			
Array Expression	D D	Left to Right			
Structure operators	->	Left to Right			
Unary minus	_	Right to Left			
Increment & Decrement	— ++	Right to Left			
One's compliment	~	Right to Left			
оне в сотпринене		Augus to Bolt			
Pointer Operators	& *	Right to Left			
Tomici Operators	a.	Right to Left			
Type cast	(data type)	Right to Left			
Type cast	(data type)	Right to Ech			
size of operator	sizeof	Right to Left			
size of operator	Sizeoi	Right to Left			
Left and Right Shift	>> <<				
Left and Right Shift					
	Arithmetic Operators				
	Artimetic Operators				
Multiplication operator, Divide	*, /, %	Left to Right			
by, Modulus					
Add, Substract	+, -	Left to Right			
Relational Operators					
Less Than	<	Left to Right			

[1	
Greater than	>	Left to Right
Less than equal to	<=	Left to Right
Greater than equal to	>=	Left to Right
Equal to	==	Left to Right
Not equal	!=	Left to Right
	Logical Operators	
AND	&&	Left to Right
OR	ll ll	Left to Right
NOT	!	Right to Left
	Bitwise Operators	
AND	&	Left to Right
Exclusive OR	^	Left to Right
Inclusive OR	I	Left to Right
	Assignment Operators	
	=	Right to Left

	*=	Right to Left
	/=	Right to Left
	%=	Right to Left
	70 —	Right to Left
	+=	Right to Left
	-=	Right to Left
	&=	Right to Left
		rugin to Bert
	^=	Right to Left
	=	Right to Left
	<<=	Right to Left
	>>=	Right to Left
	//-	Right to Left
